

METAPIN

Titanium membrane tacks

- Sterile and ready to use
- Single packaged
- Tack placement instrument with precision guide

The sterile packaging improves the safety of the clinical management reducing the time connected to the process of sterilization and cleaning.

METAPIN

METAPIN 3mm membrane tacks, set of 3 pcs.

4720

METAPIN holder

4710

The membrane tacks METAPIN are made out of Titanium in order to guarantee high resistance and maximum biocompatibility. METAPIN are specifically recommended for the placement of both resorbable and non-resorbable membranes even in areas of the jaw where the bone density is higher. The membrane tacks are available in a 3 mm length.

METAPIN HOLDER is an autoclavable bone tack placement instrument proposed with a protective cap that must be removed during the phase of pickup, and can be used in order to complete the stabilization process by dabbing on the head of the positioned tack, when required. METAPIN HOLDER features an exclusive precision guide that guarantees an improved level of stability of the tack during the phase of insertion and stabilization, thus allowing a more precise placement and a stronger grip.
